

I chose this 'The Center of Gravity of Buildings' topic because I think the center of gravity that is involved in buildings are pretty interesting. The center of gravity keeps the architecture sturdy and not fall down. Moreover, I think this topic is pretty challenging because the amount of data that can be used in this topic is very small so it will be harder to do the full infographic. The center of gravity is also very common in daily life, like when we are trying to balance or piling thing up without letting them drop to the ground etc. Next, my contents in this infographic is introducing the center of gravity and telling inner structures of buildings. I can write a lot of information in this infographic since my topic is suitable for that. My design is kind of a statistics-based one. It has more facts than other graphs.
