

My artwork shows a town with mathematical structures and busy people doing normal day to day activities. The wide range of buildings in my drawing are inspired by mathematical 3D shapes like cones and cylinders, some of them are also inspired by real architecture like the headquarters of the Bank of China and the Sydney opera house, there are also buildings influenced by mathematical terms I learnt at school like the frustum and Pythagoras theorem. In conclusion, my drawing is to promote mathematics in architecture by fun and interesting buildings.
